

LOGISTICS OPERATIONS COMMAND CENTER

Operational, financial and fleet performance | Capstone analytical report

Prepared by Opeyemi Obikoya • September 2026

1. Executive summary

The four-page Power BI dashboard examines logistics revenue, service reliability, route detention, fleet health, safety and customer performance. Across the available dataset, it reports \$262.53M in revenue and approximately 85K trips. Fuel and maintenance together account for \$101.32M. The 55.67% on-time event rate and longer detention at delivery locations are priority areas for further operational investigation. These observations describe patterns in the dataset; causal explanations require additional analysis.

Metric	Dashboard value
Total revenue	\$262.53M
Total trips	~85K
Delivery events	~171K
On-time event rate	55.67%
Average detention	91.54 minutes
Average truck utilization	83.04%
Fuel cost	\$95.59M
Maintenance cost	\$5.73M
Revenue after fuel and maintenance	\$161.20M
Safety incidents	170

2. Scope and approach

The dashboard brings together operational, financial, customer, vehicle, maintenance, route, delivery-event and safety data. Four Power BI pages present aggregate KPIs and interactive year, load-type, event-type, maintenance-type and customer-type views. Findings below are based on the latest unfiltered dashboard screenshots supplied for this report; underlying record-level analysis was not independently repeated here.

3. Findings and recommendations

3.1 Executive overview

Revenue and cost. Revenue totals \$262.53M. Fuel (\$95.59M) and maintenance (\$5.73M) total \$101.32M, or approximately 38.6% of revenue. The resulting \$161.20M is revenue after these two cost categories, not net profit.

Recommended next step: Evaluate fuel consumption and cost by route, truck and driver; incorporate other operating expenses before estimating profitability.

Service reliability. About 95K of 171K delivery events are on time (55.67%); about 76K (44.33%) are late.

Recommended next step: Prioritize investigation of late-event concentrations by route, facility and event type.

3.2 Delivery and route intelligence

Detention differs by event type. Delivery events average 106.6 minutes of detention, compared with 76.5 minutes for pickups: a 30.1-minute difference.

Recommended next step: Examine unloading capacity, appointment adherence and waiting time at delivery facilities; test whether high detention coincides with lateness.

Highest average detention routes. RTE00042 (93.8 min), RTE00044 (93.6 min), RTE00039 and RTE00058 (93.5 min each), and RTE00035 (93.4 min) lead the route chart.

Recommended next step: Review these routes alongside event volume, facilities and delivery outcomes before prioritizing intervention.

Delivery volume by city. Kansas City leads the displayed top five at 14.6K events, followed by Philadelphia (12.0K), Portland and Seattle (11.8K each), and Columbus (10.6K).

Recommended next step: Compare service reliability and capacity against event volume rather than assuming the busiest city is the most delayed.

3.3 Fleet health and safety

Fleet utilization. Average truck utilization is 83.04%; the monthly chart generally fluctuates around 82–85%.

Recommended next step: Review utilization at truck level alongside downtime, demand and route allocation; check any source-level utilization values exceeding 100% before drawing vehicle-level conclusions.

Inspection downtime. Inspections have the lowest displayed maintenance cost (~\$0.22M) but the highest total downtime (~10.7K hours).

Recommended next step: Investigate whether scheduling, queueing, inspection duration or follow-up repairs explain downtime.

Preventable incidents. Of 170 incidents, 64 are marked preventable (37.65%). DOT violations (39) are the largest displayed incident type; accidents and equipment damage each have 35.

Recommended next step: Segment preventable incidents by type, driver and truck, and assess targeted training, inspections and corrective action.

3.4 Customer and financial performance

Customer segments. Contract customers account for approximately \$99M in revenue, compared with Spot (~\$83M) and Dedicated (~\$81M).

Recommended next step: Assess margin and service performance by customer type before making retention or pricing decisions.

Customer concentration. First Group is the largest customer shown at \$9.1M. Other displayed leading customers include First Logistics (\$6.4M), Metro Wholesale (\$5.4M) and XYZ Wholesale (\$5.3M).

Recommended next step: Track concentration and service performance for major accounts; verify exact customer totals from an exported table for external publication.

Geographic patterns. The route-origin map displays revenue-generating origins across the United States, but exact city revenue rankings are not labeled in the screenshot.

Recommended next step: Export route-origin revenue before naming leading markets or proposing location-specific investment.

4. Reporting limitations

- January 2025 contains approximately two days of scheduled-event records and is excluded from the monthly on-time trend to avoid direct comparison with complete months. Its records remain in the dataset and in other unfiltered measures.
- The on-time KPI describes recorded pickup and delivery events, not necessarily the percentage of entire trips completed on time.
- Revenue after fuel and maintenance is not net profit: wages, insurance, depreciation, overhead and other expenses are not deducted.
- Chart labels are rounded. Exact customer, city and route figures should be confirmed from exported underlying data before detailed external claims.
- Associations between detention, delays, maintenance and safety are hypotheses to test, not established causal findings.

5. Priority next analyses

1. Cross-tabulate late events by route, event type and facility; compare average detention for late versus on-time events.
2. Calculate cost per mile, fuel efficiency by truck and route, and fuel cost trends.
3. Review inspection downtime by truck and maintenance record to identify avoidable delays.
4. Calculate customer-level contribution margin once full attributable costs are available.

6. Dashboard overview
